
**STEYERMARKOCHLOA
ANGUSTIFOLIA (SPRENGEL)
JUDZIEWICZ, A NEW
COMBINATION (POACEAE–
ARUNDINOIDEAE–
STEYERMARKOCHLOEAE)**

The recent return to the U.S. National Herbarium of a loan of species of *Pariana* (Poaceae–Bambusoideae–Olyreae) included a fragment of the type of *Pariana angustifolia* Sprengel, which proved to be identical to the species described as *Steyermarkochloa unifolia* (Poaceae–Arundinoideae–Steyermarkochloaeae) by Davidse & Ellis (Ann. Missouri Bot. Gard. 71: 994–1012. 1984). This was confirmed by examination of the IDC microfiche of B-WILLD sheet 18792. The following new combination is therefore required:

Steyermarkochloa angustifolia (Sprengel)
Judziewicz, comb. nov. Based on *Pariana an-*

gustifolia Sprengel, Syst. Veg. 2: 609. 1825.
TYPE: Venezuela. Amazonas: Atabapo, *Humboldt s.n.* (holotype, B not seen; fragment US).

Steyermarkochloa unifolia Davidse & Ellis, Ann. Missouri Bot. Gard. 71: 995. 1984.

In addition to Venezuelan and Colombian populations cited by Davidse & Ellis (loc. cit.), the species is also known from nearby Amazonas, Brazil at São Felipe on the Rio Negro (*Fróes 28788*, US).
